CHAPTER 1:INTRODUCTION

✳ 1.1 Introduction to Business Intelligence with Power BI

In today's data-driven world, organizations collect massive amounts of data from various sources—sales transactions, customer interactions, social media, and more. However, raw data alone is not useful unless it is transformed into actionable insights. That's where **Business Intelligence (BI)** comes in.

Business Intelligence refers to the technologies, applications, and practices used to collect, integrate, analyze, and present business data. Its goal is to support better business decision-making.

One of the most popular and user-friendly BI tools available today is **Power BI**, developed by Microsoft. Power BI allows users—from beginners to experts—to turn data into interactive visual dashboards and reports, helping organizations uncover trends, monitor performance, and make data-driven decisions.

1.2 🔍 Why Power BI?

- **Easy to Use:** With drag-and-drop features and pre-built visualizations, Power BI is beginner-friendly.
- **Powerful Data Modeling:** Connect to multiple data sources (Excel, databases, cloud services) and transform data with Power Query.
- **Interactive Dashboards:** Create dynamic visuals that allow for deep exploration of business metrics.
- **Cloud Sharing:** Share reports and dashboards online for team collaboration and real-time updates.

1.3 📊 What You Can Do with Power BI

- Track **sales performance** across different regions.
 - Visualize **customer behavior** and preferences.
 - Monitor **financial KPIs** like revenue, profit, and expenses.
 - Forecast **trends** using historical data.
 - Identify **bottlenecks** and opportunities for growth.
-

Power BI empowers both individuals and enterprises to make **informed, strategic decisions** by bringing data to life. Whether you're a student, analyst, manager, or business owner, learning Power BI opens doors to smarter data analysis and better business outcomes.

CHAPTER 2 :TASK COMPLETION GUIDE

2.1 DATA TRANSFORMATION

Data transformation in Power Query refers to the process of cleaning, shaping, and restructuring raw data into a format suitable for analysis. This step is essential to ensure the data is accurate, consistent, and ready for reporting in Power BI.

Using Power Query's intuitive interface, you can perform tasks like:

- Removing or filtering rows
- Splitting or merging columns
- Changing data types
- Renaming columns
- Pivoting/unpivoting data
- Handling missing or duplicate values

Each transformation step is recorded automatically, allowing you to trace or modify your workflow anytime.

 *The data used in this project was downloaded from [Codebasics-Master Data Analyst Course online from Scratch | Codebasics](#) as part of their Resume Projects series. All credit goes to Codebasics for providing practical learning resources.*

PROBLEM STATEMENT

AtliQ Grands owns multiple five-star hotels across India. They have been in the hospitality industry for the past 20 years. Due to strategic moves from other competitors

and ineffective decision-making in management, AtliQ Grands are losing its market share and revenue in the luxury/business hotels category. As a strategic move, the managing director of AtliQ Grands wanted to incorporate “Business and Data Intelligence” to regain their market share and revenue. However, they do not have an in-house data analytics team to provide them with these insights.

Their revenue management team had decided to hire a 3rd party service provider to provide them with insights from their historical data.

Task:

You are a data analyst who has been provided with sample data and a mock-up dashboard to work on the following task. You can download all relevant documents from the download section.

1. Create the metrics according to the metric list.
2. Create a dashboard according to the mock-up provided by stakeholders.
3. Create relevant insights that are not provided in the metric list/mock-up dashboard.

The file contains all the meta information regarding the columns described in the CSV files provided 5 CSV files:

1. dim_date
2. dim_hotels
3. dim_rooms
4. fact_aggregated_bookings
5. fact_bookings

Column Description for dim_date:

1. date: This column represents the dates present in May, June and July.
2. mmm yy: This column represents the date in the format of mmm yy (monthname year).
3. week no: This column represents the unique week number for that particular date.
4. day_type: This column represents whether the given day is Weekend or Weekeday.

Column Description for dim_hotels:

1. property_id: This column represents the Unique ID for each of the hotels.
2. property_name: This column represents the name of each hotel.
3. category: This column determines which class[Luxury, Business] a particular hotel/property belongs to.
4. city: This column represents where the particular hotel/property resides in.

Column Description for dim_rooms:

1. room_id: This column represents the type of room[RT1, RT2, RT3, RT4] in a hotel.
2. room_class: This column represents to which class[Standard, Elite, Premium, Presidential] particular room type belongs.

Column Description for fact_aggregated_bookings:

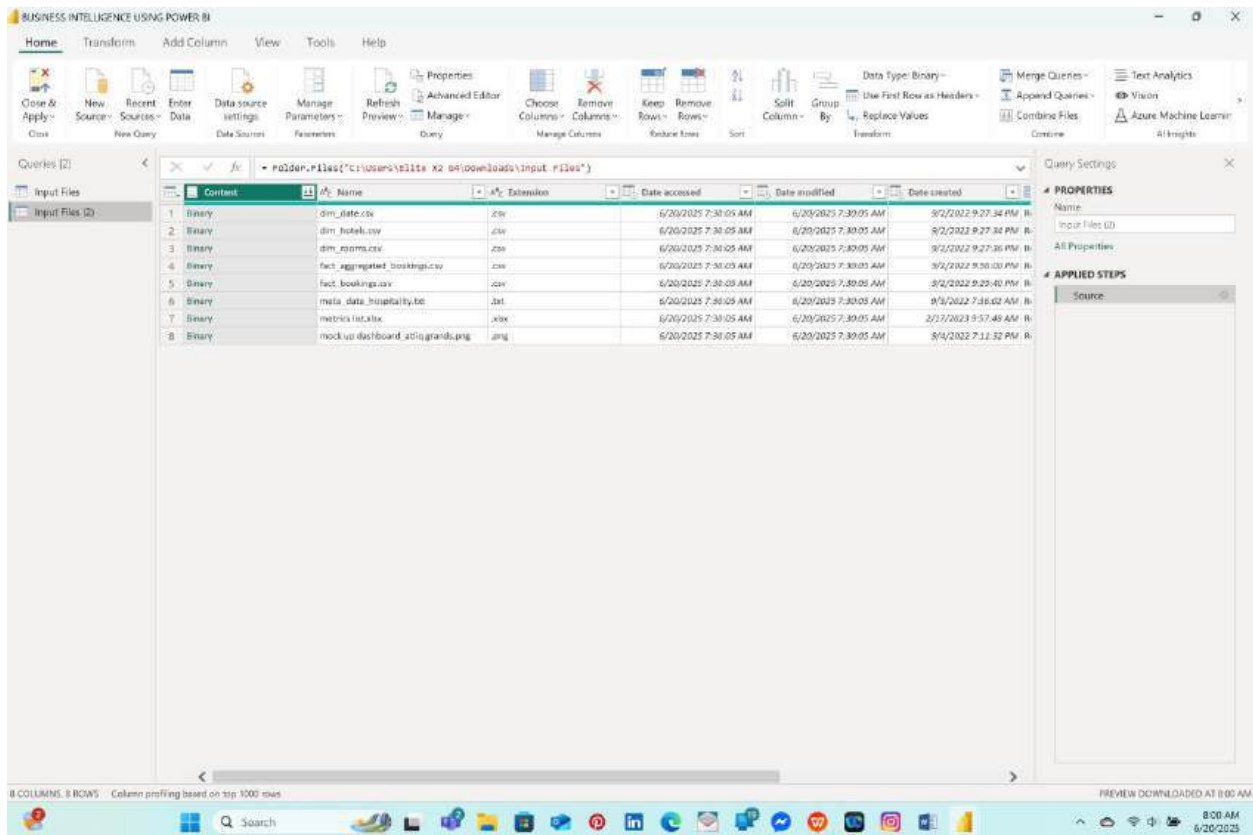

1. property_id: This column represents the Unique ID for each of the hotels.
2. check_in_date: This column represents all the check_in_dates of the customers.

3. room_category: This column represents the type of room[RT1, RT2, RT3, RT4] in a hotel.
4. successful_bookings: This column represents all the successful room bookings that happen for a particular room type in that hotel on that particular date.
5. capacity: This column represents the maximum count of rooms available for a particular room type in that hotel on that particular date.

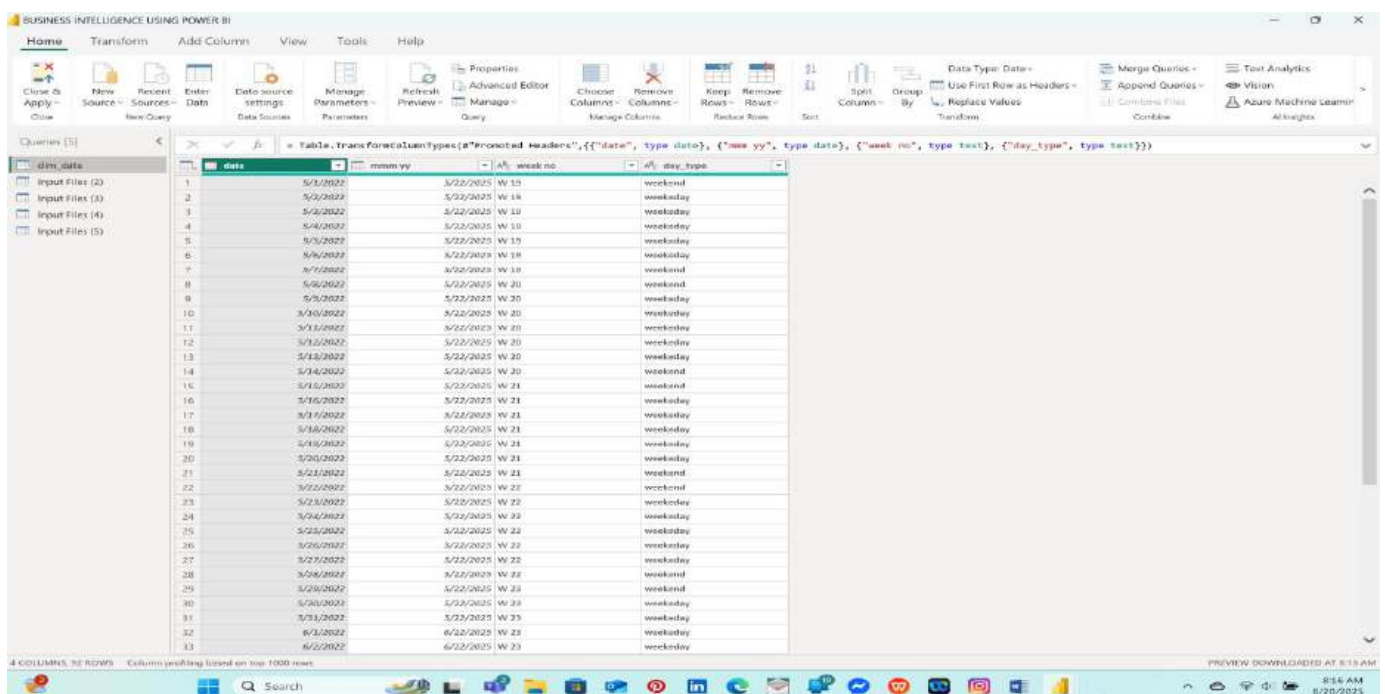

Column Description for fact_bookings:

1. booking_id: This column represents the Unique Booking ID for each customer when they booked their rooms.
2. property_id: This column represents the Unique ID for each of the hotels
3. booking_date: This column represents the date on which the customer booked their rooms.
4. check_in_date: This column represents the date on which the customer check-in(entered) at the hotel.
5. check_out_date: This column represents the date on which the customer check-out(left) of the hotel.
6. no_guests: This column represents the number of guests who stayed in a particular room in that hotel.
7. room_category: This column represents the type of room[RT1, RT2, RT3, RT4] in a hotel.
8. booking_platform: This column represents in which way the customer booked his room
9. ratings_given: This column represents the ratings given by the customer for hotel services.
10. booking_status: This column represents whether the customer cancelled his booking[Cancelled], successfully stayed in the hotel[Checked Out] or booked his room but not stayed in the hotel[No show].
11. revenue_generated: This column represents the amount of money generated by the hotel from a particular customer.
12. revenue_realized: This column represents the final amount of money that goes to the hotel based on booking status. If the booking status is cancelled, then 40% of the revenue generated is deducted and the remaining is refunded to the customer. If the booking status is Checked Out/No show, then full revenue generated will go to hotels.

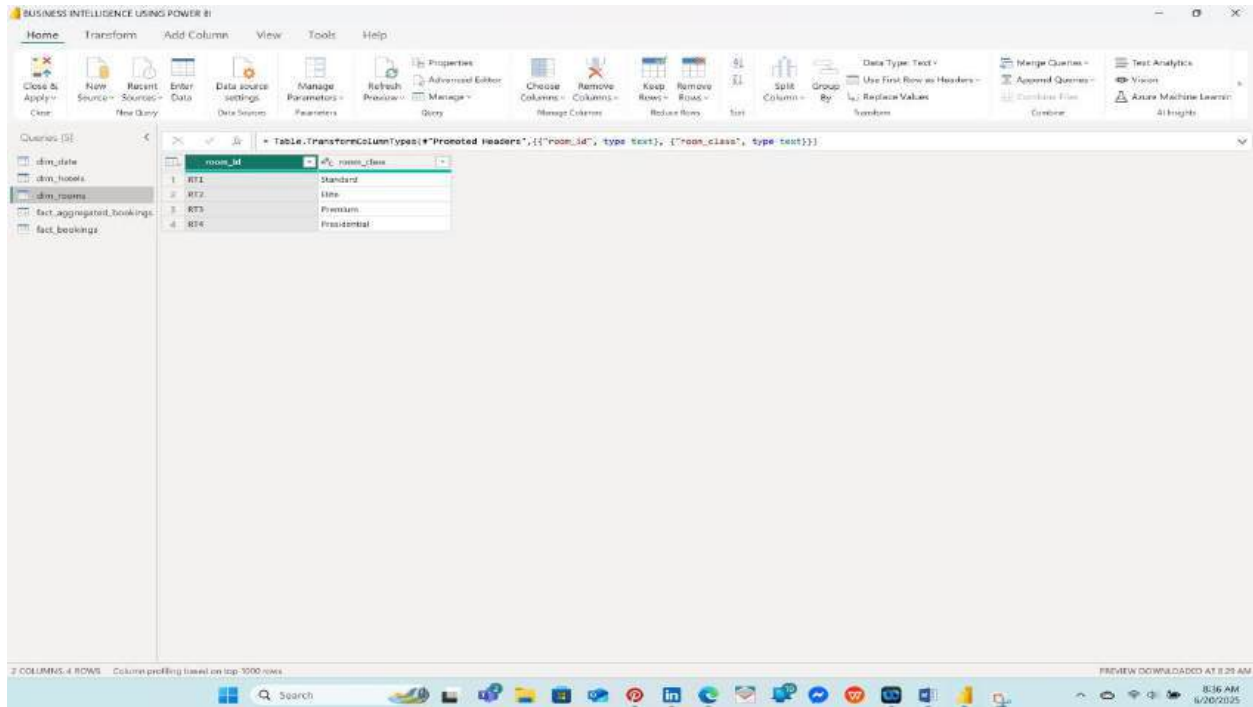

To load data from a folder named **"Input Files"** (located in **Downloads**), go to **Power BI Desktop**, click **"Get Data" > "Folder">Connect**, then browse to `Downloads\Input Files` and click **OK**. Power BI will show a preview of the files. Click **"Transform Data"** to open the **Power Query Editor**. In Power Query, you'll see a table listing the files in the folder. To preserve the original data, **right-click** on the query named **"Input Files"** in the **Queries pane** and select **"Duplicate"**. This creates a copy of the query that you can clean or modify while keeping the original unchanged

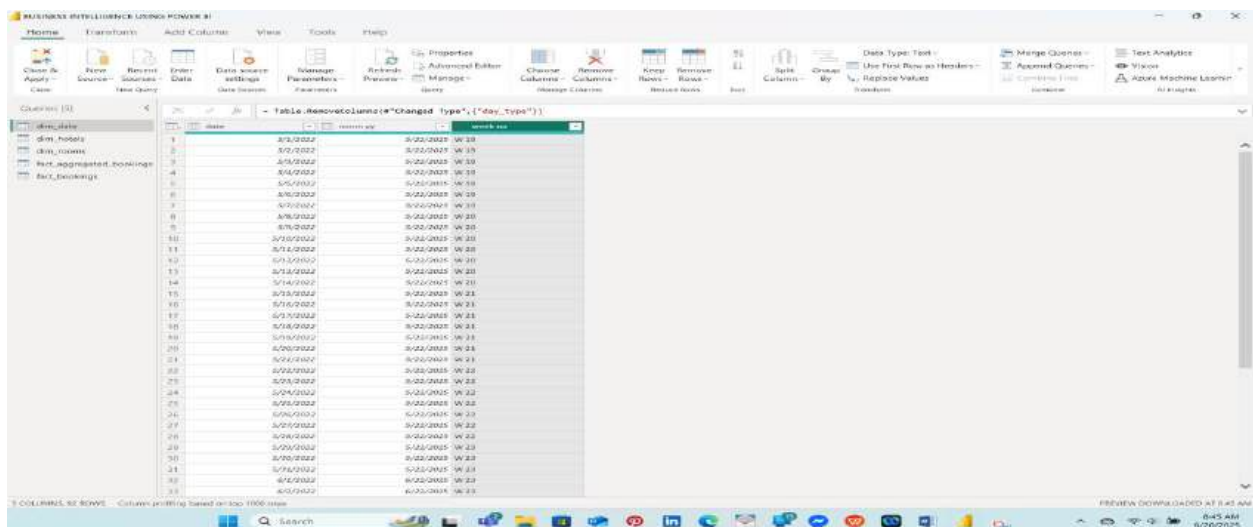

GO To **Input Files** click Binary(dim_date.csv) to expand the file, which has dates categorized into two groups, **weekday** and **weekend**, and **RENAME** it as **dim_date**. **DUPLICATE** Input Files (2) a couple of times

RENAME INPUT 2 as **dim_hotels**, INPUT 3 as **dim_rooms**, and change the **COLUMN 1** and **COLUMN 2** on the dim_rooms table to **room_id** and **room_class**, respectively, by clicking the “use first row as header ” option on, INPUT 4 as **fact_aggregated_bookings**, and INPUT 5 as **fact_bookings**.

In the hotel business, Fridays and Saturdays are considered weekends, but in the dim_date table, weekends are Saturday and Sunday. The **day_type** column is not useful, so I deleted it by clicking “**Remove**” on the drop-down menu

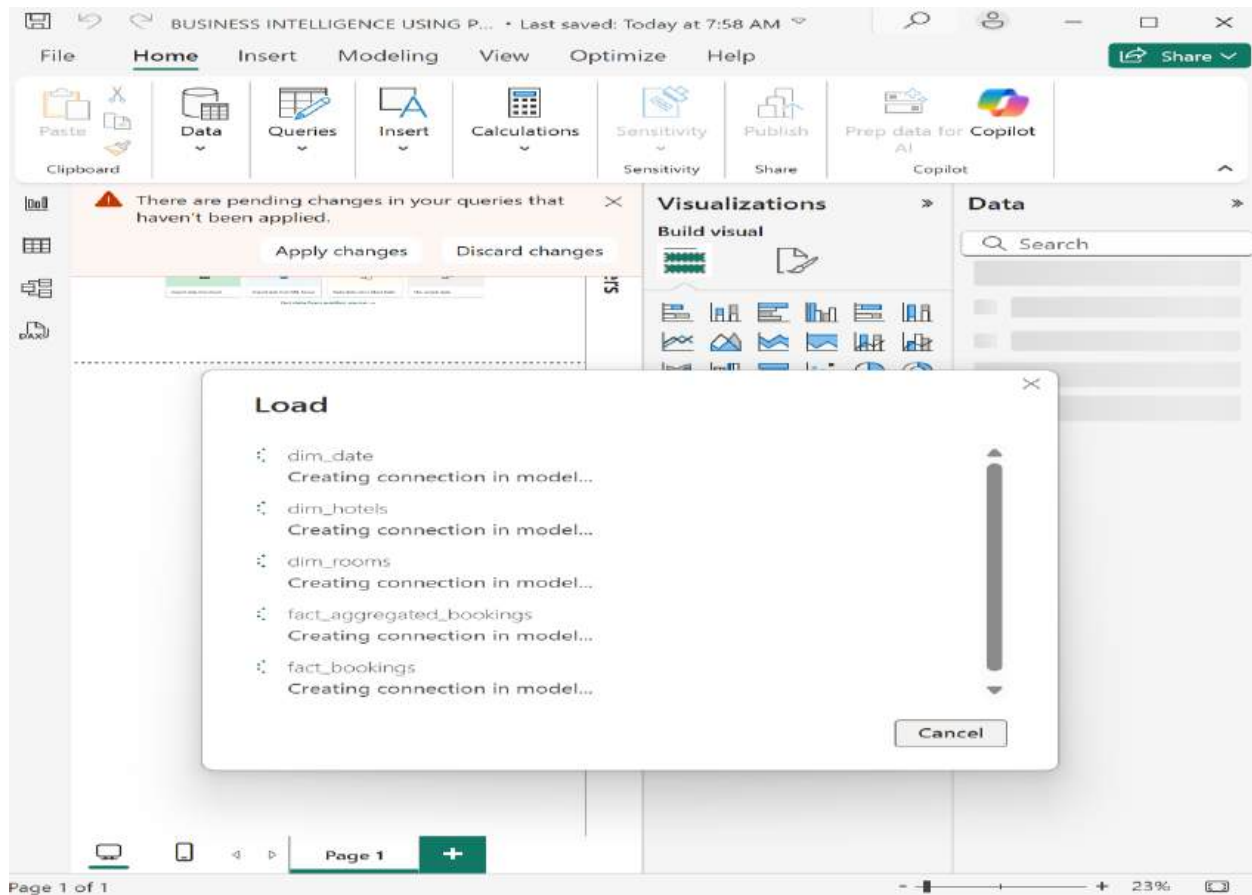

>ADDING DAY TYPES

DAY NAME = FORMAT('dim_date'[date],"dddd")

The screenshot shows the Microsoft Power BI Desktop interface. The DAX formula bar at the top displays the formula: `DAY NAME = FORMAT('dim_date'[date],"dddd")`. Below the formula bar, a preview of the data table is shown. The table has the following columns: `date`, `mmm yy`, `week no`, `wn`, `day tpe`, and `DAY NAME`. The data rows show dates from Sunday, May 1, 2022, to Thursday, June 2, 2022, with corresponding day names (e.g., Sunday, Monday, Tuesday, etc.).

date	mmm yy	week no	wn	day tpe	DAY NAME
Sunday, May 1, 2022	May 22, 2025	W 19	19	Weekday	Sunday
Monday, May 2, 2022	May 22, 2025	W 19	19	Weekday	Monday
Tuesday, May 3, 2022	May 22, 2025	W 19	19	Weekday	Tuesday
Wednesday, May 4, 2022	May 22, 2025	W 19	19	Weekday	Wednesday
Thursday, May 5, 2022	May 22, 2025	W 19	19	Weekday	Thursday
Friday, May 6, 2022	May 22, 2025	W 19	19	Weekend	Friday
Saturday, May 7, 2022	May 22, 2025	W 19	19	Weekend	Saturday
Sunday, May 8, 2022	May 22, 2025	W 20	20	Weekday	Sunday
Monday, May 9, 2022	May 22, 2025	W 20	20	Weekday	Monday
Tuesday, May 10, 2022	May 22, 2025	W 20	20	Weekday	Tuesday
Wednesday, May 11, 2022	May 22, 2025	W 20	20	Weekday	Wednesday
Thursday, May 12, 2022	May 22, 2025	W 20	20	Weekday	Thursday
Friday, May 13, 2022	May 22, 2025	W 20	20	Weekend	Friday
Saturday, May 14, 2022	May 22, 2025	W 20	20	Weekend	Saturday
Sunday, May 15, 2022	May 22, 2025	W 21	21	Weekday	Sunday
Monday, May 16, 2022	May 22, 2025	W 21	21	Weekday	Monday
Tuesday, May 17, 2022	May 22, 2025	W 21	21	Weekday	Tuesday
Wednesday, May 18, 2022	May 22, 2025	W 21	21	Weekday	Wednesday
Thursday, May 19, 2022	May 22, 2025	W 21	21	Weekday	Thursday
Friday, May 20, 2022	May 22, 2025	W 21	21	Weekend	Friday
Saturday, May 21, 2022	May 22, 2025	W 21	21	Weekend	Saturday
Sunday, May 22, 2022	May 22, 2025	W 22	22	Weekday	Sunday
Monday, May 23, 2022	May 22, 2025	W 22	22	Weekday	Monday
Tuesday, May 24, 2022	May 22, 2025	W 22	22	Weekday	Tuesday
Wednesday, May 25, 2022	May 22, 2025	W 22	22	Weekday	Wednesday
Thursday, May 26, 2022	May 22, 2025	W 22	22	Weekday	Thursday
Friday, May 27, 2022	May 22, 2025	W 22	22	Weekend	Friday
Saturday, May 28, 2022	May 22, 2025	W 22	22	Weekend	Saturday
Sunday, May 29, 2022	May 22, 2025	W 23	23	Weekday	Sunday
Monday, May 30, 2022	May 22, 2025	W 23	23	Weekday	Monday
Tuesday, May 31, 2022	May 22, 2025	W 23	23	Weekday	Tuesday
Wednesday, June 1, 2022	June 22, 2025	W 23	23	Weekday	Wednesday
Thursday, June 2, 2022	June 22, 2025	W 23	23	Weekday	Thursday

Next Click on the “**CLOSE & APPLY**” Under “**HOME**” to conclude the steps under POWER QUERY step of DATA TRANSFORMATION

2.2 DATA MODELLING

2.2.1 Data Modeling in Power BI

Data modeling in Power BI is the process of connecting and organizing multiple tables using relationships to create a structured and meaningful data model. It allows you to link data from different sources using keys (like IDs) so you can analyze them together seamlessly.

In the **Model view**, you can:

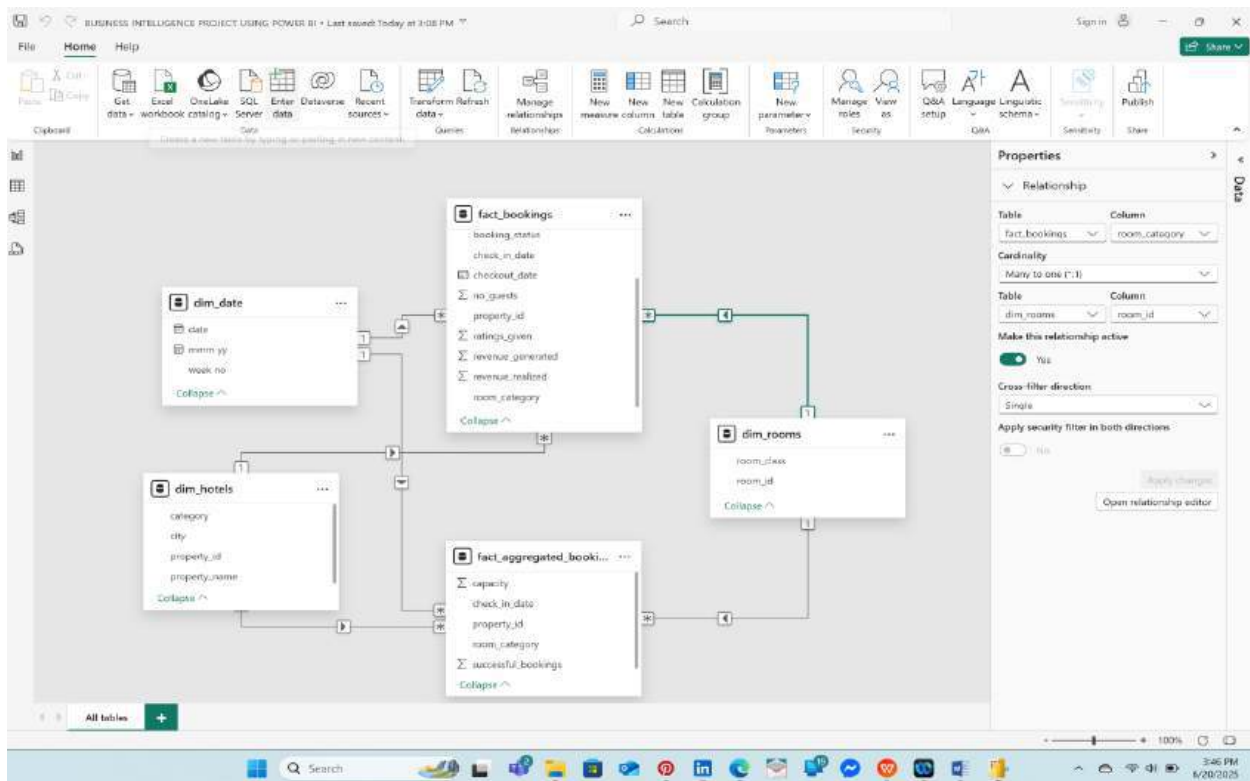

- Define **relationships** between tables (one-to-many, many-to-one)
- Create **calculated columns** and **measures** using DAX (Data Analysis Expressions)
- Set **data types** and **table hierarchies**

A well-designed data model ensures accurate calculations, improves performance, and makes reporting more intuitive and efficient.

2.2.2 ☆ Star Schema Model

The **Star Schema** is a widely adopted data modeling technique used in business intelligence to optimize data for reporting and analysis. It features a **central fact table** containing key business metrics (such as sales, profit, or transactions), which is directly linked to multiple **dimension tables** that provide contextual information (such as time, product, customer, or region). This structure resembles a star, with the fact table at the center and dimensions radiating outward. The star schema simplifies complex data relationships, enhances query performance, and supports intuitive, self-service analytics. It is especially effective in Power BI for building scalable, easy-to-navigate models that align with business reporting needs.

I established a relationship between **room_id** under the **dim_rooms** table to the **room category** in **fact_bookings** table and the **fact_aggregated bookings**. Another relationship was between the **date** in the **dim_date** table and the **check-in date** in **fact-aggregate bookings** and **fact_bookings**

2.2.3 📊 Data Analysis Expressions (DAX)

Data Analysis Expressions (DAX) is a powerful formula language used in Power BI, Excel, and other Microsoft data tools to create custom calculations and business logic within data models.

DAX enables users to build **measures**, **calculated columns**, and **calculated tables** that go beyond standard aggregations, allowing for advanced analytics such as year-over-year comparisons, cumulative totals, dynamic filtering, and key performance indicators (KPIs).

In a business context, DAX empowers analysts and decision-makers to:

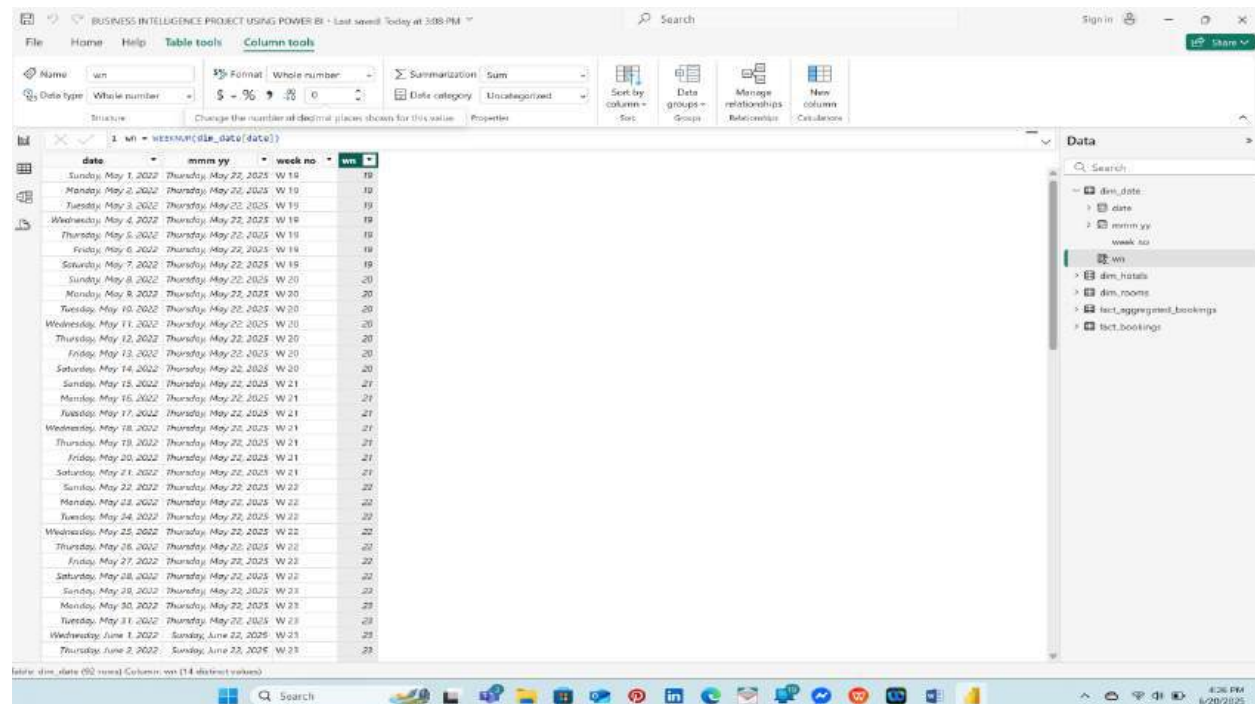

- Tailor calculations to specific organizational metrics
- Generate insightful dashboards with dynamic and context-aware data
- Drive performance monitoring through customized KPIs and trend analysis

By combining DAX with a well-structured data model, organizations can unlock deeper insights, support data-driven decisions, and align reporting with strategic business goals.

2.2.3.1 CALCULATED COLUMNS

Using the **TABLE VIEW** option, I decided to remove the **W** in the **week no** Column on the **dim_date** table so that the column can contain only a numerical by right-clicking on the column>New Column> **DAX FORMULA USED- 1 wn = WEEKNUM(dim_date[date]).**This resulted to a New Column

***NOTE:** wn stands for WEEK NUMBER in this case*

date	mmm yy	week no	wn
Sunday, May 1, 2022	Thursday, May 22, 2025	W 19	19
Monday, May 2, 2022	Thursday, May 22, 2025	W 19	19
Tuesday, May 3, 2022	Thursday, May 22, 2025	W 19	19
Wednesday, May 4, 2022	Thursday, May 22, 2025	W 19	19
Thursday, May 5, 2022	Thursday, May 22, 2025	W 19	19
Friday, May 6, 2022	Thursday, May 22, 2025	W 19	19
Saturday, May 7, 2022	Thursday, May 22, 2025	W 19	19
Sunday, May 8, 2022	Thursday, May 22, 2025	W 20	20
Monday, May 9, 2022	Thursday, May 22, 2025	W 20	20
Tuesday, May 10, 2022	Thursday, May 22, 2025	W 20	20
Wednesday, May 11, 2022	Thursday, May 22, 2025	W 20	20
Thursday, May 12, 2022	Thursday, May 22, 2025	W 20	20
Friday, May 13, 2022	Thursday, May 22, 2025	W 20	20
Saturday, May 14, 2022	Thursday, May 22, 2025	W 20	20
Sunday, May 15, 2022	Thursday, May 22, 2025	W 21	21
Monday, May 16, 2022	Thursday, May 22, 2025	W 21	21
Tuesday, May 17, 2022	Thursday, May 22, 2025	W 21	21
Wednesday, May 18, 2022	Thursday, May 22, 2025	W 21	21
Thursday, May 19, 2022	Thursday, May 22, 2025	W 21	21
Friday, May 20, 2022	Thursday, May 22, 2025	W 21	21
Saturday, May 21, 2022	Thursday, May 22, 2025	W 21	21
Sunday, May 22, 2022	Thursday, May 22, 2025	W 22	22
Monday, May 23, 2022	Thursday, May 22, 2025	W 22	22
Tuesday, May 24, 2022	Thursday, May 22, 2025	W 22	22
Wednesday, May 25, 2022	Thursday, May 22, 2025	W 22	22
Thursday, May 26, 2022	Thursday, May 22, 2025	W 22	22
Friday, May 27, 2022	Thursday, May 22, 2025	W 22	22
Saturday, May 28, 2022	Thursday, May 22, 2025	W 22	22
Sunday, May 29, 2022	Thursday, May 22, 2025	W 23	23
Monday, May 30, 2022	Thursday, May 22, 2025	W 23	23
Tuesday, May 31, 2022	Thursday, May 22, 2025	W 23	23
Wednesday, June 1, 2022	Sunday, June 22, 2025	W 23	23
Thursday, June 2, 2022	Sunday, June 22, 2025	W 23	23

Previously, I had deleted the **day_type** column that indicated the **WEEKEND AND WEEKDAY** info. So adding another column that represents this concept, using the DAX FORMULA > **day_type = WEEKDAY(dim_date[date])**

The days are number from 1 to 7 with Sunday being 1 and Saturday being 7 in ascending order. So if the weekday number is > 5 then it is a weekend and in this case it is Saturday and Friday, Sunday is therefore a weekday as per the hotel booking business in India mentioned in the problem statement.

The screenshot shows the Microsoft Power BI Desktop interface. The formula bar at the top displays the DAX formula: `1 day_type = WEEKDAY(dim_date[date])`. The ribbon at the top includes 'Table tools' and 'Column tools' tabs. The 'Table tools' ribbon shows the 'Name' property set to 'day_type', 'Data type' set to 'Whole number', and 'Format' set to 'Whole number'. The 'Column tools' ribbon shows the 'Summarization' set to 'Sum' and 'Data category' set to 'Uncategorized'. The 'Table' view shows a table with columns: 'date', 'mmmm yy', 'week no', 'wkd', and 'day_type'. The table contains 32 rows of data, showing dates from Sunday, May 1, 2022, to Thursday, June 2, 2022. The 'day_type' column contains values from 1 to 5, representing weekdays. The 'Table' view is selected in the 'Data' pane on the right. The status bar at the bottom indicates 'Table: dim_date (82 rows) Column: day_type (7 distinct values)'.

date	mmmm yy	week no	wkd	day_type
Sunday, May 1, 2022	Thursday, May 22, 2025	W 19	19	1
Monday, May 2, 2022	Thursday, May 22, 2025	W 19	19	2
Tuesday, May 3, 2022	Thursday, May 22, 2025	W 19	19	3
Wednesday, May 4, 2022	Thursday, May 22, 2025	W 19	19	4
Thursday, May 5, 2022	Thursday, May 22, 2025	W 19	19	5
Friday, May 6, 2022	Thursday, May 22, 2025	W 19	19	6
Saturday, May 7, 2022	Thursday, May 22, 2025	W 19	19	7
Sunday, May 8, 2022	Thursday, May 22, 2025	W 20	20	1

Table: dim_date (62 rows) Column: day_type (2 distinct values)

: CREATING KEY MEASURES

Measures	Description / Purpose	DAX FORMULA	TABLE
1 Revenue	To get the total revenue realized	Revenue = SUM(fact_bookings[revenue_realized])	fact_bookings
2 Total Bookings	To get the total number of bookings happened	Total Bookings = COUNT(fact_bookings[booking_id])	fact_bookings
3 Total Capacity	To get the total capacity of rooms present in hotels	Total Capacity = SUM(fact_aggregated_bookings[capacity])	fact_aggregated_bookings
4 Total Successful Bookings	To get the total successful bookings happened for all hotels	Total Successful Bookings = SUM(fact_aggregated_bookings[succesful_bookings])	fact_aggregated_bookings
5 Occupancy %	Occupancy means total successful bookings happened to the total rooms available(capacity)	Occupancy % = DIVIDE([Total Successful Bookings],[Total Capacity],0)	fact_aggregated_bookings
6 Average Rating	Get the average ratings given by the customers	Average Rating = AVERAGE(fact_bookings[ratings_given])	fact_bookings
7 No of days	To get the total number of days present in the data. In our case, we have data from May to July. So 92 days.	No of days = DATEDIFF(MIN(dim_date[date]),MAX(dim_date[date]),DAY)+1 dim_date	
8 Total cancelled bookings	To get the "Cancelled" bookings out of all Total bookings happened calculating the cancellation percentage.	Total cancelled bookings = CALCULATE([Total Bookings],fact_bookings[booking_status]="Cancelled")	fact_bookings
9 Cancellation %		Cancellation % = DIVIDE([Total cancelled bookings],[Total Bookings])	fact_bookings
10 Total Checked Out	To get the successful "Checked out" bookings out of all Total bookings happened	Total Checked Out = CALCULATE([Total Bookings],fact_bookings[booking_status]="Checked Out")	fact_bookings
11 Total no show bookings	To get the "No Show" bookings out of all Total bookings happened	Total no show bookings = CALCULATE([Total Bookings],fact_bookings[booking_status]="No Show")	fact_bookings
12 No Show rate %	["No show" means those customers who neither cancelled nor attend to their booked rooms]	No Show rate % = DIVIDE([Total no show bookings],[Total Bookings])	fact_bookings
13 Booking % by Platform	calculating the no show percentage for bookings in hotels.	Booking % by Platform = DIVIDE([Total Bookings], CALCULATE([Total Bookings], ALL(fact_bookings[booking_platform])))	fact_bookings
	We have booking platforms like makeyourtrip, logtrip, tripster etc)		

The screenshot shows an Excel spreadsheet with a table of hotel metrics. The table has four columns: Sn, Measures, Description / Purpose, DAX FORMULA, and TABLE. The metrics listed are Booking % by Room class, ADR (Average Daily Rate), Realisation %, RevPAR (Revenue Per Available Room), and DBRN (Daily Booked Room Nights). Each metric includes a description of its purpose and the DAX formula used to calculate it.

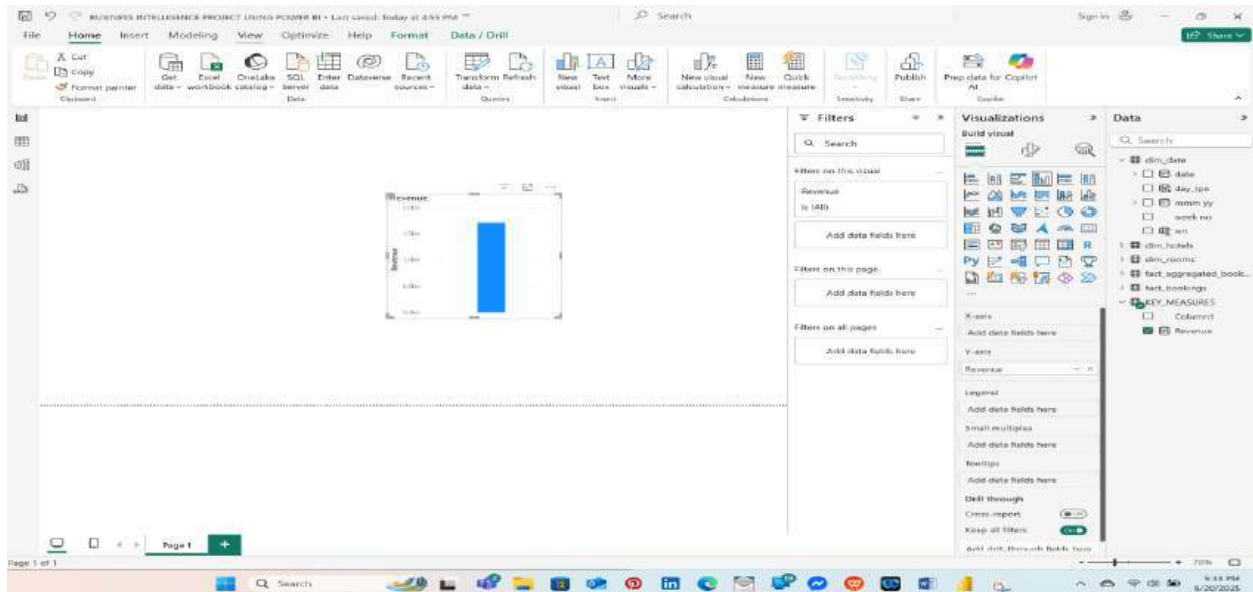

Sn	Measures	Description / Purpose	DAX FORMULA	TABLE
14	Booking % by Room class	We have room classes like Standard, Elite, Premium, Presidential. Calculate the ADR(Average Daily rate)	$\text{CALCULATE}([\text{Total Bookings}], \text{ALL}(\text{dim_rooms}[\text{room_class}])) * 100$	fact_bookings, dim_rooms
15	ADR	It is the ratio of revenue to the total rooms booked/sold. It is the measure of the average paid for rooms sold in a given time period calculate the realisation percentage.	$\text{ADR} = \text{DIVIDE}([\text{Revenue}], [\text{Total Bookings}], 0)$	fact_bookings
16	Realisation %	It is nothing but the succesful "checked out" percentage over all bookings happened. Calculate the RevPAR(Revenue Per Available Room)	$\text{Realisation \%} = 1 - ([\text{Cancellation \%}] + [\text{No Show rate \%}])$	fact_bookings
17	RevPAR	RevPAR represents the revenue generated per available room, whether or not they are occupied. RevPAR helps hotels measure their revenue generating performance to accurately price rooms. RevPAR can help hotels measure themselves against other properties or brands. calculate DBRN(Daily Booked Room Nights)	$\text{RevPAR} = \text{DIVIDE}([\text{Revenue}], [\text{Total Capacity}])$	fact_bookings, fact_agg_bookings
18	DBRN	This metrics tells on average how many rooms are booked for a day considering a time period calculate OSRN(Daily Sellable Room Nights)	$\text{DBRN} = \text{DIVIDE}([\text{Total Bookings}], [\text{No of days}])$	fact_bookings, dim_date
		This metrics tells on average how many rooms are ready to sell for a day considering a time period		

1.REVENUE

Click on **REPORT VIEW>THE THREE DOTS AT THE FIELDS MENU>NEW MEASURE>REVENUE>DRAG & DROP REVENUE**

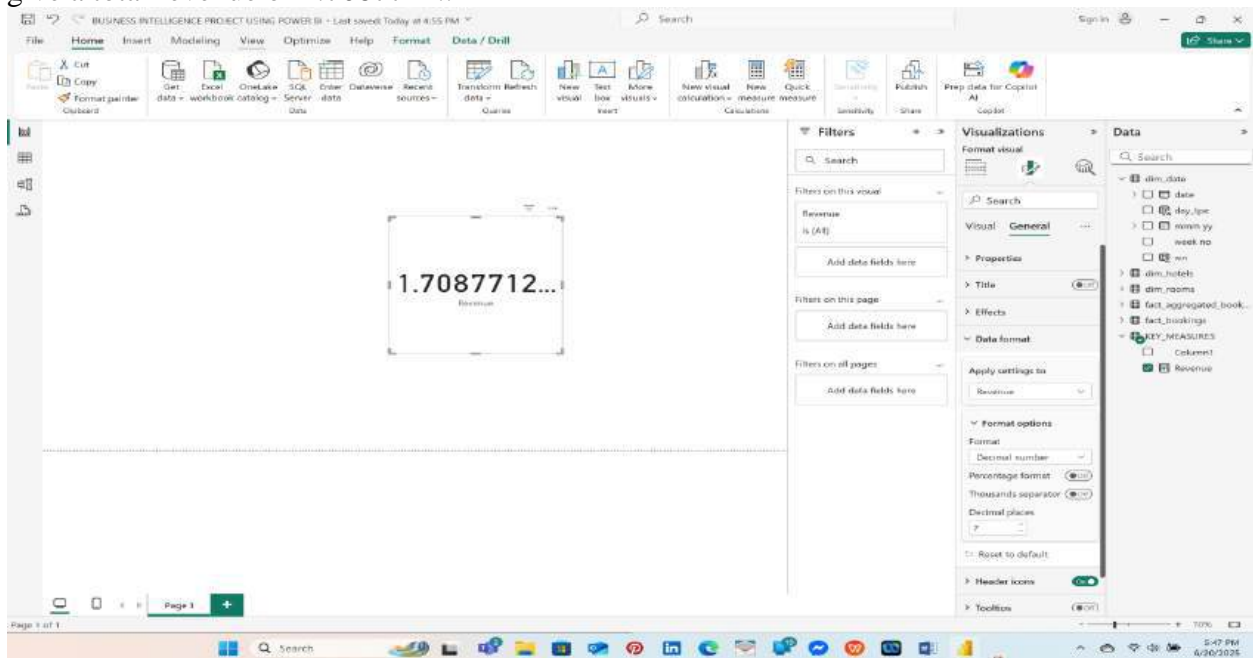

Alternatively, To group into Separate Categories, CLICK **ENTER DATA** on the HOME tab ,on the **Table prompt,delete and rename as KEY MEASURES** and press **ENTER**

Click **KEY_MEASURES>COLUMN 1>NEW MEASURE** and use formula $\text{Revenue} = \text{SUM}(\text{fact_bookings}[\text{revenue_realized}])$ and then **DRAG & DROP Revenue** to the center of the Workspace.

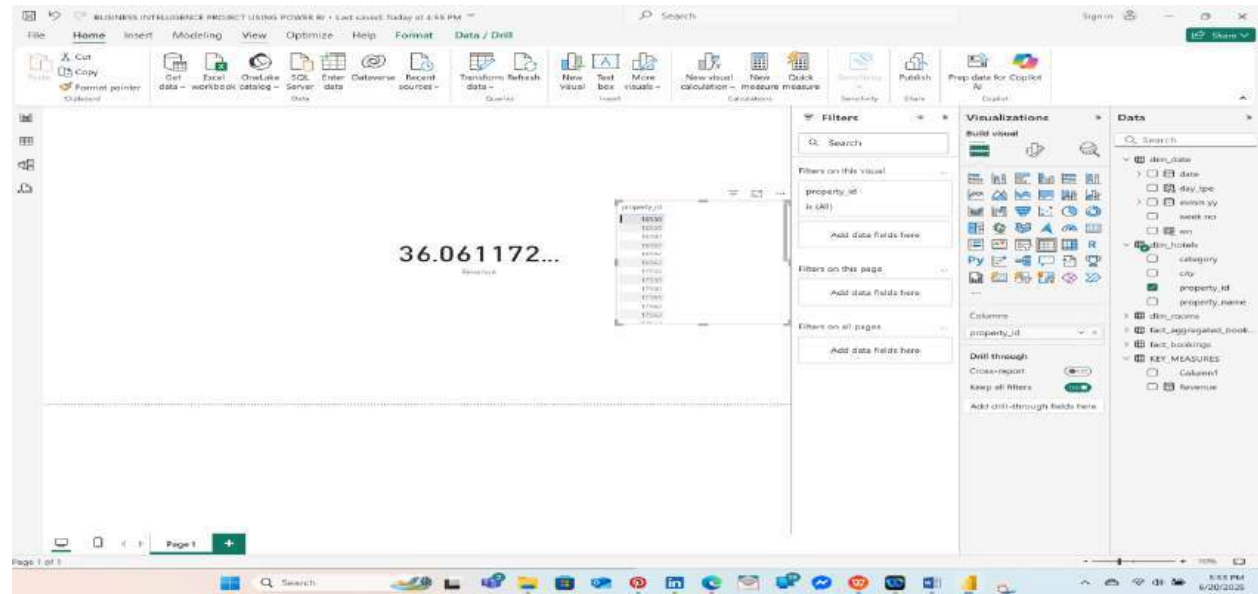

You can click on the CARD icon Under Visualizations to view it as a figure.

GO to Visualizations>General>Apply Settings to and select Revenue> Decimal places and it will give a total revenue of 1.7087712..

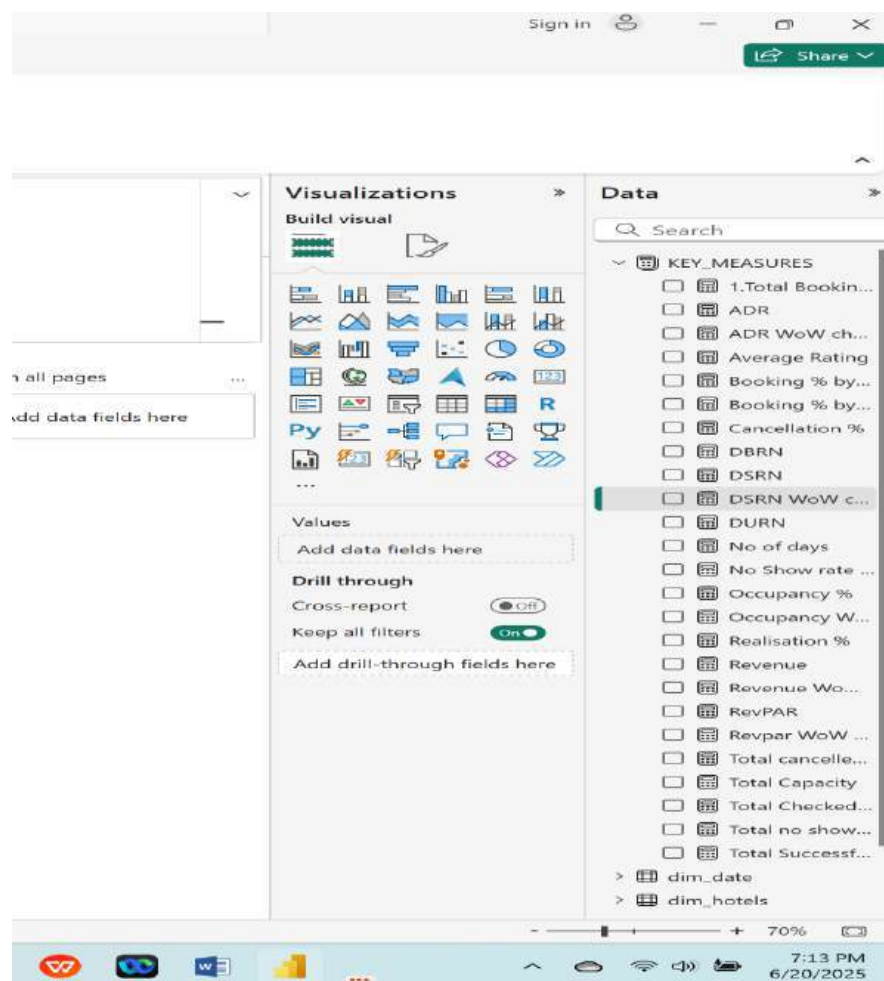

To check Revenue from a particular property say 16558,click dim_hotels>property_id>drag and drop property_id to the center of the workspace and it will show a figure of 36.06117M and

16559 will be 118.44841M and on and on

2.3: DASHBOARD CREATION

Dashboarding with Power BI involves creating interactive visual representations of data to help users monitor key metrics, analyze trends, and make informed decisions. Power BI, a business analytics tool by Microsoft, allows users to connect to various data sources, clean and transform data, and build rich dashboards using visual elements like charts, graphs, maps, and KPIs.

Dashboards in Power BI are highly customizable and dynamic, enabling real-time data updates and user interactivity through filters and slicers. They are commonly used in business reporting, performance tracking, and data storytelling across industries. Whether for executives needing a high-level overview or analysts diving into detailed data, Power BI dashboards make complex data easy to understand and act upon.

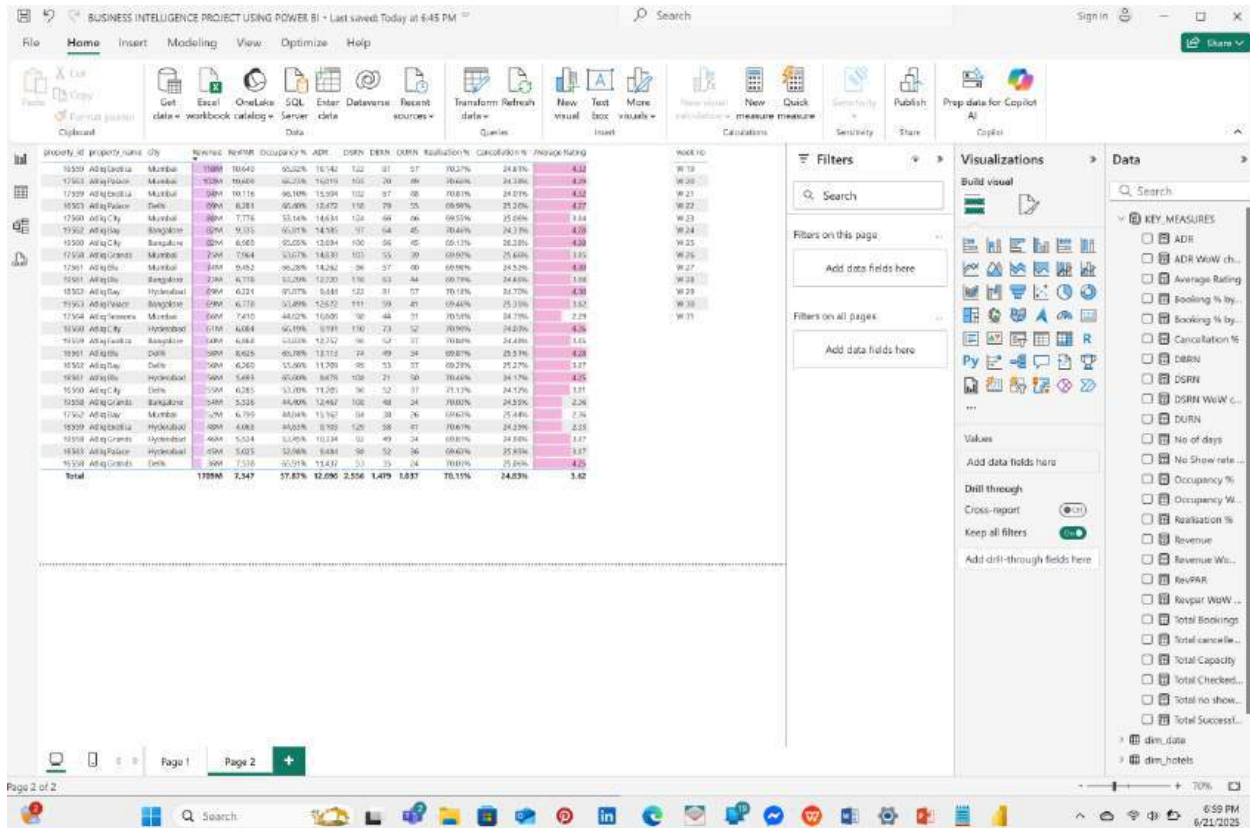

2.3.1.CHART CREATION

-I filtered out WEEK 32 because it only has a single dataset and it might affect my skewness.

-I change the data formatting in revenue to Millions and removed all decimal places in the chart so as to have exact values.

-In Revenue and Average Rating I applied **CONDITIONAL FORMATTING** to the Data bars and chose color purple.

3.0:CONCLUSION

The AtliQ hospitality analytics project provided valuable insights into guest booking behavior and stay patterns across the business. By analyzing key dimensions such as number of days stayed, booking pace, and their corresponding frequencies and percentages, we were able to uncover trends that can inform operational and marketing strategies.

3.1Key findings include:

- Short stays (1–3 days) make up the majority of bookings, indicating a preference for quick getaways or business travel. A significant portion of bookings are made within 7 days of check-in, highlighting opportunities for last-minute promotions.
- The use of calculated fields such as “Booking Pace”, “Stay Days Frequency %”, and “2 guests/room” helped transform raw data into business-ready insights.
- Custom tables like sort_stay_days enabled accurate sorting and filtering for clear, interactive dashboards.
- Overall, this project has empowered stakeholders with data-driven visibility into guest behaviors, enabling more targeted decision-making around pricing, staffing, and marketing campaigns.
